

Periodic Strings

A character string is said to have period k if it can be formed by concatenating one or more repetitions of another string of length k . For example, the string "abcabcabcabc" has period 3, since it is formed by 4 repetitions of the string "abc". It also has periods 6 (two repetitions of "abcabc") and 12 (one repetition of "abcabcabcabc").

Write a program to read a character string and determine its smallest period.

Input

The first line of the input file will contain a single integer N indicating how many test cases that your program will test followed by a blank line. Each test case will contain a single character string of up to 80 non-blank characters. **Two consecutive input will be separated by a blank line.**

Output

An integer denoting the smallest period of the input string for each input. **Two consecutive outputs are separated by a blank line.**

Sample Input

1

HoHoHo

Sample Output

2
