Cache Performance (1)

- Measuring cache performance
  - Components of CPU time
    - Program execution cycles include cache hit time
    - Memory stall cycles: mainly from cache misses
  - With simplifying assumptions:

\[
\text{Memory stall cycles} = \frac{\text{Memory accesses}}{\text{Program}} \times \text{Miss rate} \times \text{Miss penalty}
\]

\[
= \frac{\text{Instructions}}{\text{Program}} \times \frac{\text{Misses}}{\text{Instruction}} \times \text{Miss penalty}
\]
Cache Performance (2)

- **Example: Given**
  - I-cache miss rate = 2%
  - D-cache miss rate = 4%
  - Miss penalty = 100 cycles
  - Base CPI (ideal cache) = 2
  - Load & stores are 36% of instructions

- **Miss cycles per instruction**
  - I-cache: $0.02 \times 100 = 2$
  - D-cache: $0.36 \times 0.04 \times 100 = 1.44$

- **Actual CPU** $= 2 + 2 + 1.44 = 5.44$
  - Ideal CPU is $5.44/2 = 2.72$ times faster
Cache Performance (3)

- **Average access time**
  - Hit time is also important for performance
  - Average memory access time (AMAT)
    - AMAT = Hit time + Miss rate x Miss penalty
  - Example
    - CPU with 1ns clock
    - Hit time = 1 cycle
    - Miss penalty = 20 cycles
    - I-cache miss rate = 5%

    - AMAT = 1 + 0.05 x 20 = 2ns
      » 2 cycles per instruction
Cache Performance (4)

- **Performance summary**
  - When CPU performance increased
    - Miss penalty becomes more significant
  - Decreasing base CPI
    - Greater proportion of time spent on memory stalls
  - Increasing clock rate
    - Memory stalls account for more CPU cycles
  - Can’t neglect cache behavior when evaluating system performance
Associative Caches (1)

- **Fully associative**
  - Allow a given block to go in any cache entry
  - Requires all entries to be searched at once
  - Comparator per entry (expensive)

- **n-way set associative**
  - Each set contains n entries
  - Block number determines which set
    - (Block number) modulo (#Sets in cache)
  - Search all entries in a given set at once
  - n comparators (less expensive)
Associative Caches (2)

- **Example**

<table>
<thead>
<tr>
<th>Direct mapped</th>
<th>Set associative</th>
<th>Fully associative</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block #</td>
<td>Set #</td>
<td></td>
</tr>
<tr>
<td>0 1 2 3 4 5 6 7</td>
<td>0 1 2 3</td>
<td></td>
</tr>
<tr>
<td>Data</td>
<td>Data</td>
<td></td>
</tr>
<tr>
<td>Tag</td>
<td>Tag</td>
<td></td>
</tr>
<tr>
<td>Search</td>
<td>Search</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Spectrum of associativity: for an 8-entry cache

One-way set associative
(direct mapped)

<table>
<thead>
<tr>
<th>Block</th>
<th>Tag</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Two-way set associative

<table>
<thead>
<tr>
<th>Set</th>
<th>Tag</th>
<th>Data</th>
<th>Tag</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Four-way set associative

<table>
<thead>
<tr>
<th>Set</th>
<th>Tag</th>
<th>Data</th>
<th>Tag</th>
<th>Data</th>
<th>Tag</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Eight-way set associative (fully associative)

<table>
<thead>
<tr>
<th>Tag</th>
<th>Data</th>
<th>Tag</th>
<th>Data</th>
<th>Tag</th>
<th>Data</th>
<th>Tag</th>
<th>Data</th>
<th>Tag</th>
<th>Data</th>
<th>Tag</th>
<th>Data</th>
<th>Tag</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Associative Caches (4)

- **Associativity example: compare 4-block caches**
  - Direct mapped, 2-way set associative, fully associative
  - Block access sequence: 0, 8, 0, 6, 8

- **Direct mapped**

<table>
<thead>
<tr>
<th>Block address</th>
<th>Cache index</th>
<th>Hit/miss</th>
<th>Cache content after access</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>miss</td>
<td>Mem[0]</td>
</tr>
<tr>
<td>8</td>
<td>0</td>
<td>miss</td>
<td>Mem[8]</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>miss</td>
<td>Mem[0]</td>
</tr>
<tr>
<td>6</td>
<td>2</td>
<td>miss</td>
<td>Mem[0] Mem[6]</td>
</tr>
</tbody>
</table>
## Associative Caches (5)

### 2-way set associative

<table>
<thead>
<tr>
<th>Block address</th>
<th>Cache index</th>
<th>Hit/miss</th>
<th>Cache content after access</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>Set 0</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>miss</td>
<td>Mem[0]</td>
</tr>
<tr>
<td>8</td>
<td>0</td>
<td>miss</td>
<td>Mem[0]</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>hit</td>
<td>Mem[0]</td>
</tr>
<tr>
<td>6</td>
<td>0</td>
<td>miss</td>
<td>Mem[0]</td>
</tr>
</tbody>
</table>

### Fully associative

<table>
<thead>
<tr>
<th>Block address</th>
<th>Hit/miss</th>
<th>Cache content after access</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>miss</td>
<td>Mem[0]</td>
</tr>
<tr>
<td>8</td>
<td>miss</td>
<td>Mem[0]</td>
</tr>
<tr>
<td>0</td>
<td>hit</td>
<td>Mem[0]</td>
</tr>
</tbody>
</table>
Associative Caches (6)

- **How much associativity?**
  - Increased associativity decreases miss rate
    - But with diminishing returns
  - Simulation of a system with 64KB D-cache, 16-word blocks, SPEC2000
    - 1-way: 10.3%
    - 2-way: 8.6%
    - 4-way: 8.3%
    - 8-way: 8.1%
Associative Caches (7)

- Set associative cache organization
Replacement Policy

- **Direct mapped**: no choice
- **Set associative**
  - Prefer non-valid entry, if there is one
  - Otherwise, choose among entries in the set
- **Least-recently used (LRU)**
  - Choose the one unused for the longest time
    - Simple for 2-way, manageable for 4-way, too hard beyond that
- **Random**
  - Gives approximately the same performance as LRU for high associativity
Multilevel Caches (1)

- **Multilevel caches**
  - Primary cache attached to CPU
    - Small, but fast
  - Level-2 (L2) cache services misses from primary cache
    - Larger, slower, but still faster than main memory
  - Main memory services L2 cache misses
  - Some high-end systems include L3 cache
Multilevel Caches (2)

- Multilevel cache example: Given
  - CPU base CPI = 1
  - Clock rate = 4GHz
  - Miss rate / instruction = 2%
  - Main memory access time = 100ns

- With just primary cache
  - Miss penalty = 100ns/0.25ns = 400 cycles
  - Effective CPI = 1 + 0.02 x 400 = 9
Multilevel Caches (3)

- Now add L2 cache
  - Assumptions
    - Access time = 5ns
    - Global miss rate to main memory = 0.5%
  - Primary miss with L2 hit
    - Penalty = 5ns/0.25ns = 20 cycles
  - Primary miss with L2 miss
    - Extra penalty = 400 cycles
  - CPI = 1 + 0.02 \times 20 + 0.005 \times 400 = 3.4
  - Performance ratio = 9 / 3.4 = 2.6
Multilevel Caches (4)

- **Considerations**
  - Primary cache
    - Focus on minimal hit time
  - L2 cache
    - Focus on low miss rate to avoid main memory access
    - Hit time has less overall impact
  - Results
    - L1 cache usually smaller than a single-level cache
    - L1 block size may be smaller than L2 block size
    - L2 cache is much larger than in a single-level cache
    - L2 cache uses higher associativity for reducing miss rates
Interactions w/ Advanced CPUs

- Out-of-order CPUs can execute instructions during cache miss
  - Pending store stays in load/store unit
  - Dependent instructions wait in reservation stations
    - Independent instructions continue

- Effect of miss depends on program data flow
  - Much harder to analyze
  - Use system simulation
Interactions w/ Software

- Misses depend on memory access patterns
  - Algorithm behavior
  - Compiler optimization for memory access

- Standard algorithmic analysis often ignores the impact of the memory hierarchy
