Storage Abstraction

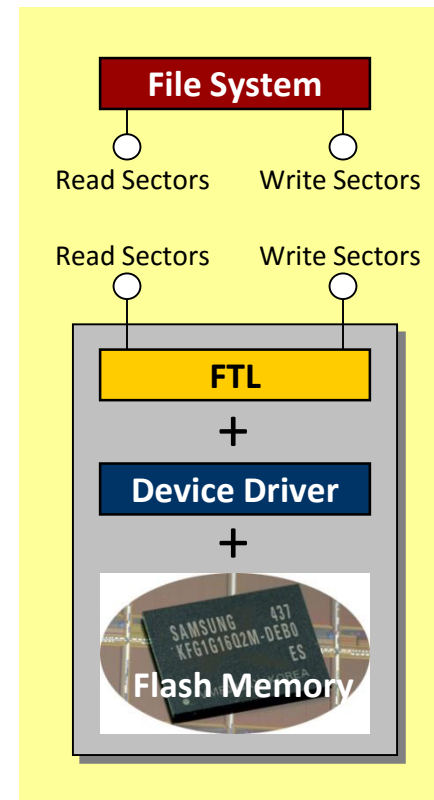

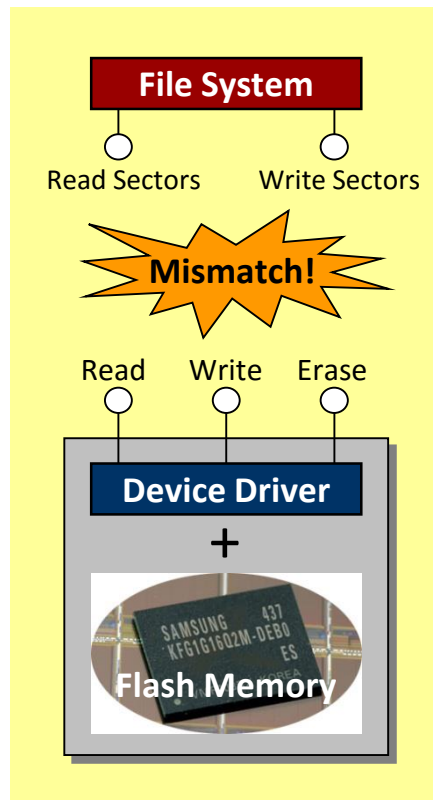

- Abstraction given by block device drivers:

- Operations
 - Identify(): returns N
 - Read (start sector #, # of sectors)
 - Write (start sector #, # of sectors, data)

What is FTL?

- A software layer to make NAND flash fully emulate traditional block devices (or disks)

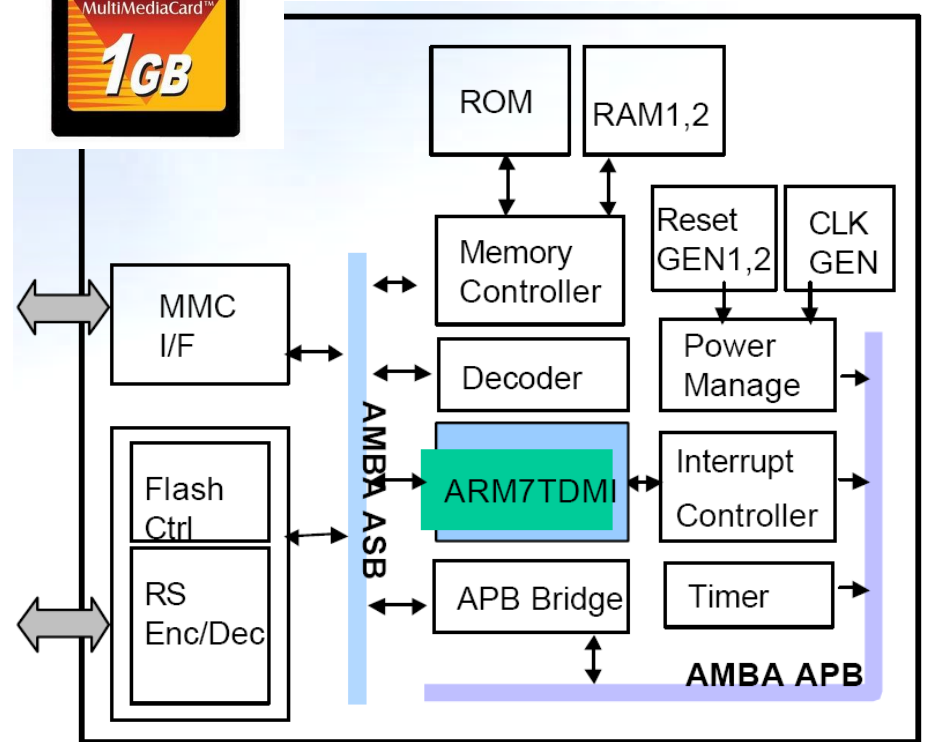

Source: Zeen Info. Tech.

Major Components in SSD

- Similar in most NAND storage systems

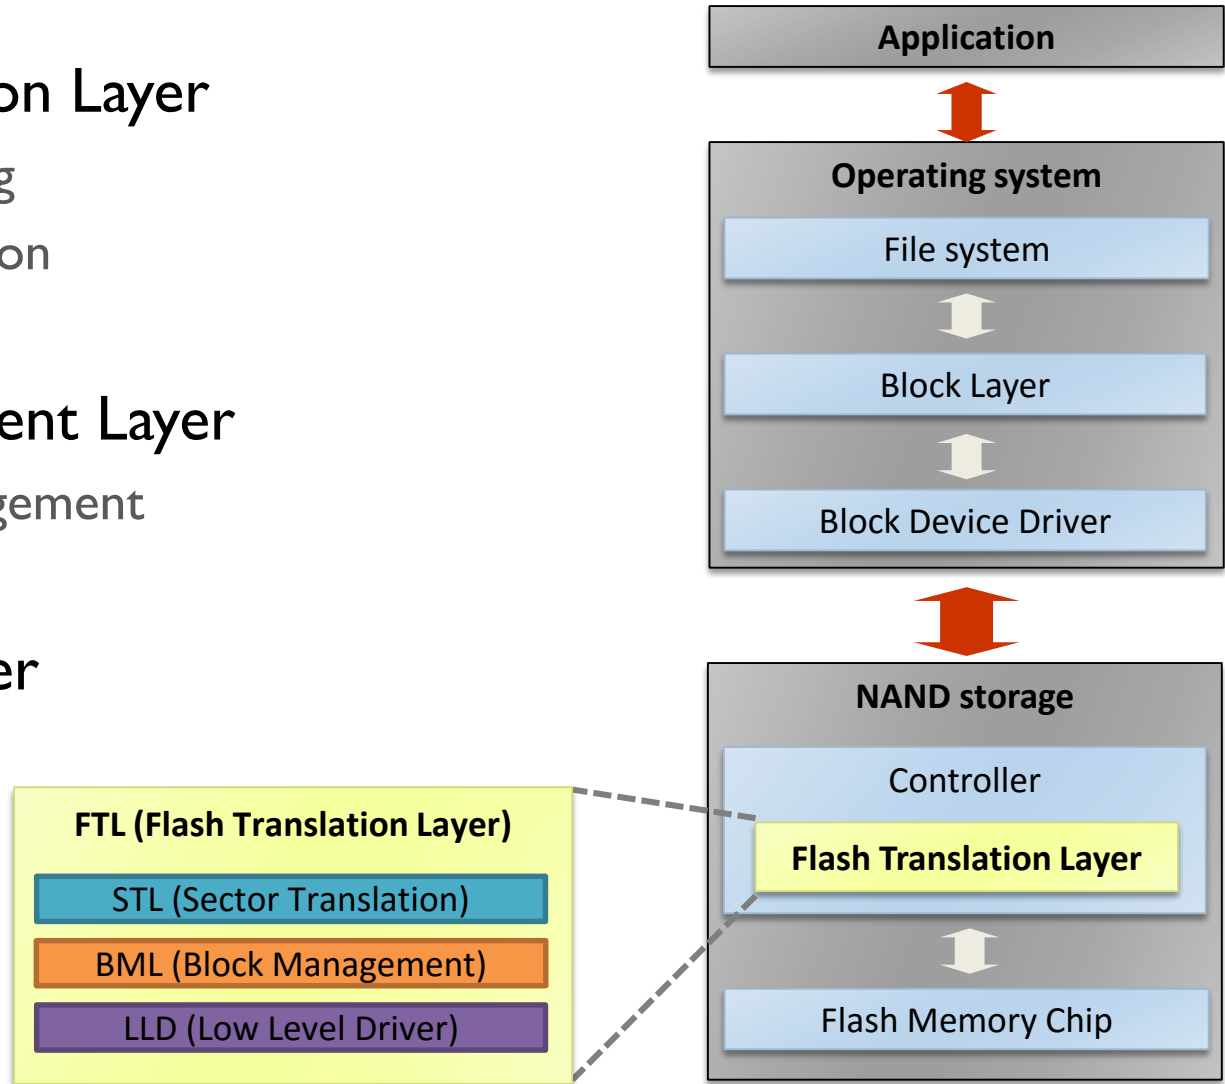

Flash Cards Internals

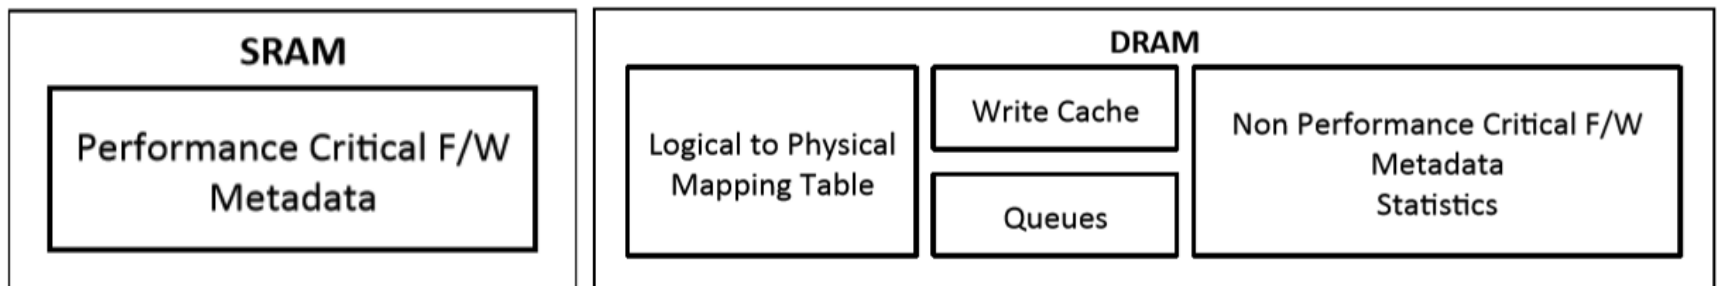

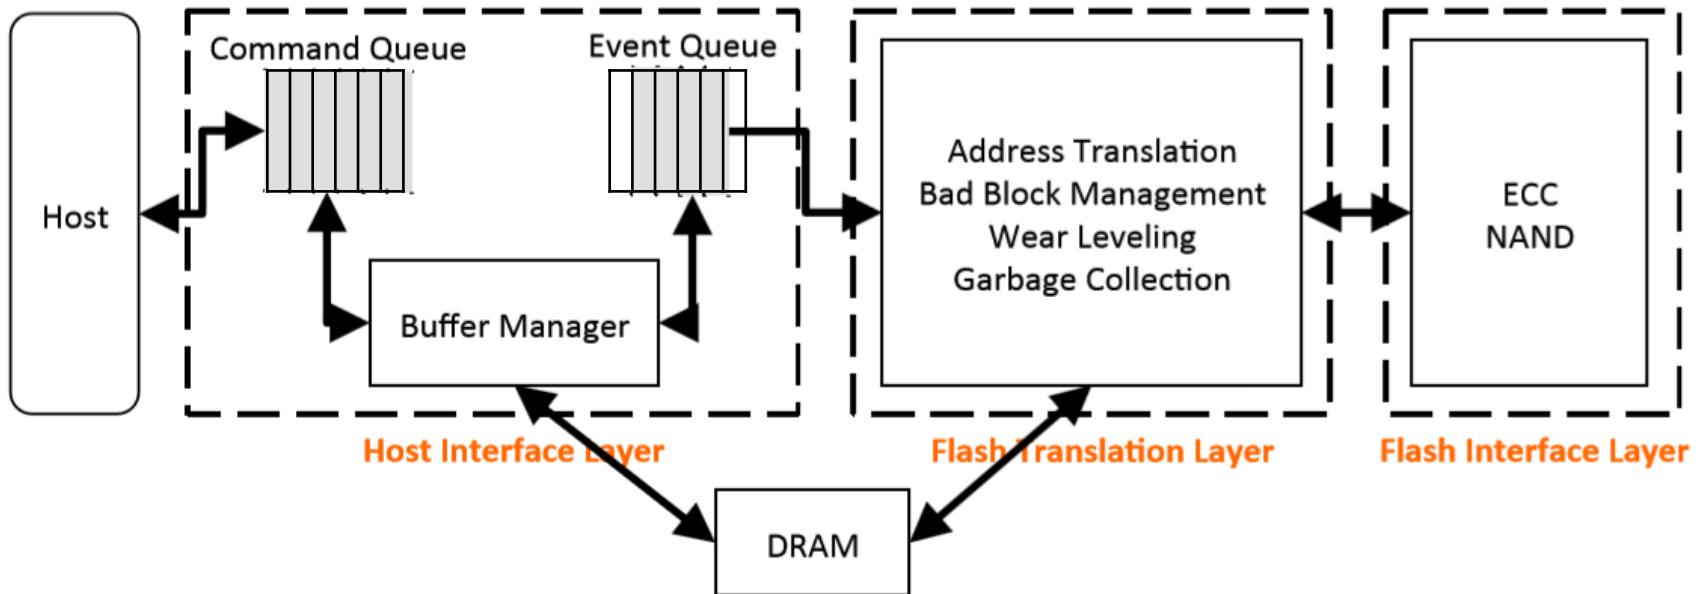

FTL Architecture

- **Sector Translation Layer**
 - Address mapping
 - Garbage collection
 - Wear leveling
- **Block Management Layer**
 - Bad block management
 - Error handling
- **Low Level Driver**
 - Flash interface

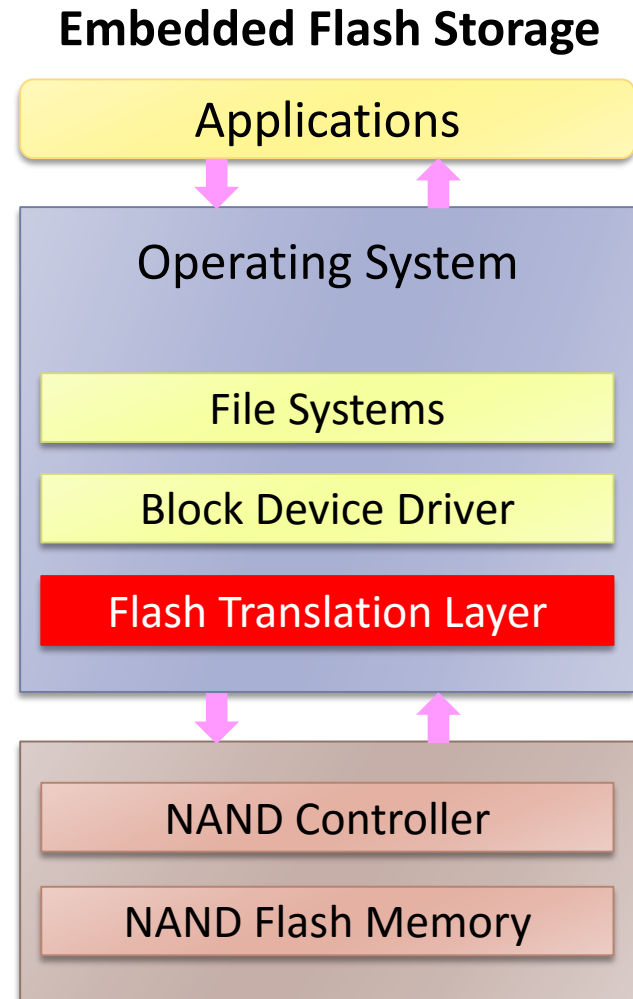

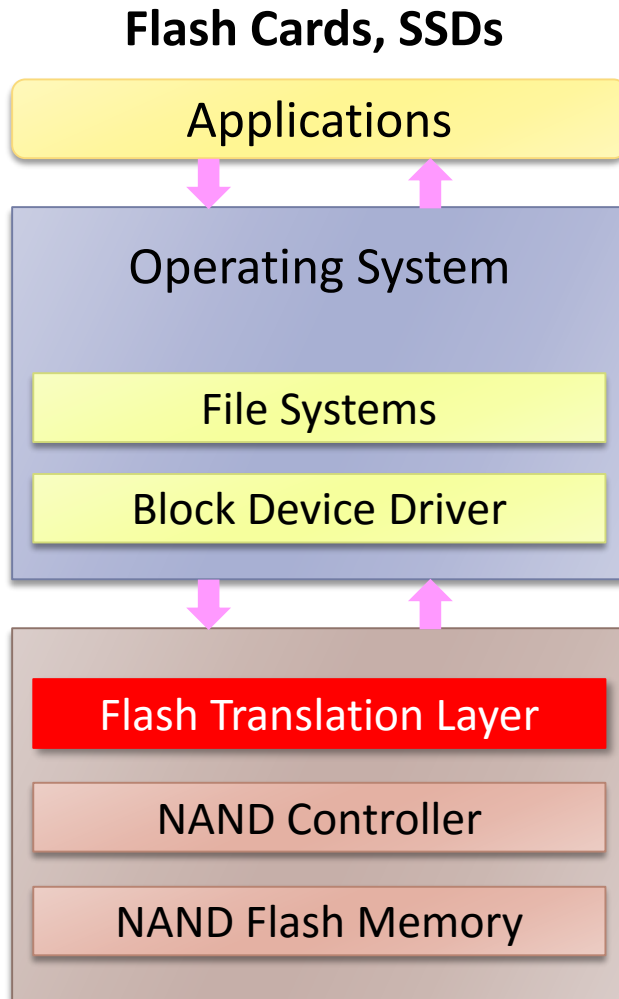

Basic Firmware Architecture

S. H. Noh and Y.-S. Kee, Flash Memory and Its By-product: A to Z in a Flash, FAST Tutorial, 2015.

Implementing FTLs

Plethora of FTLs

SAST SFTL HFTL MS FTL BPLRU

BFTL AFTL FAST LazyFTL KAST

Chameleon CNFTL DFTL LAST MNFTL

super-block scheme CFTL Log block scheme

GFTL μ -FTL JFTL zFTL

Hydra FTL Vanilla FTL Replacement block scheme

Reconfigurable FTL YanusFTL

WAFTL UFTL and so on

Performance Features

- Indirect mapping (address translation)
- Garbage collection
- Over-provisioning
- Hot/cold data identification/separation
- Exploiting parallelism over multiple channels/flash chips/planes
- Request scheduling of multiple commands
- Buffer management
- ...

Reliability Features

- Bad block management
- Wear leveling
- Power-off recovery
- Error detection and correction
- Countermeasures for cell characteristics
- ...

Other Features

Encryption

Compression

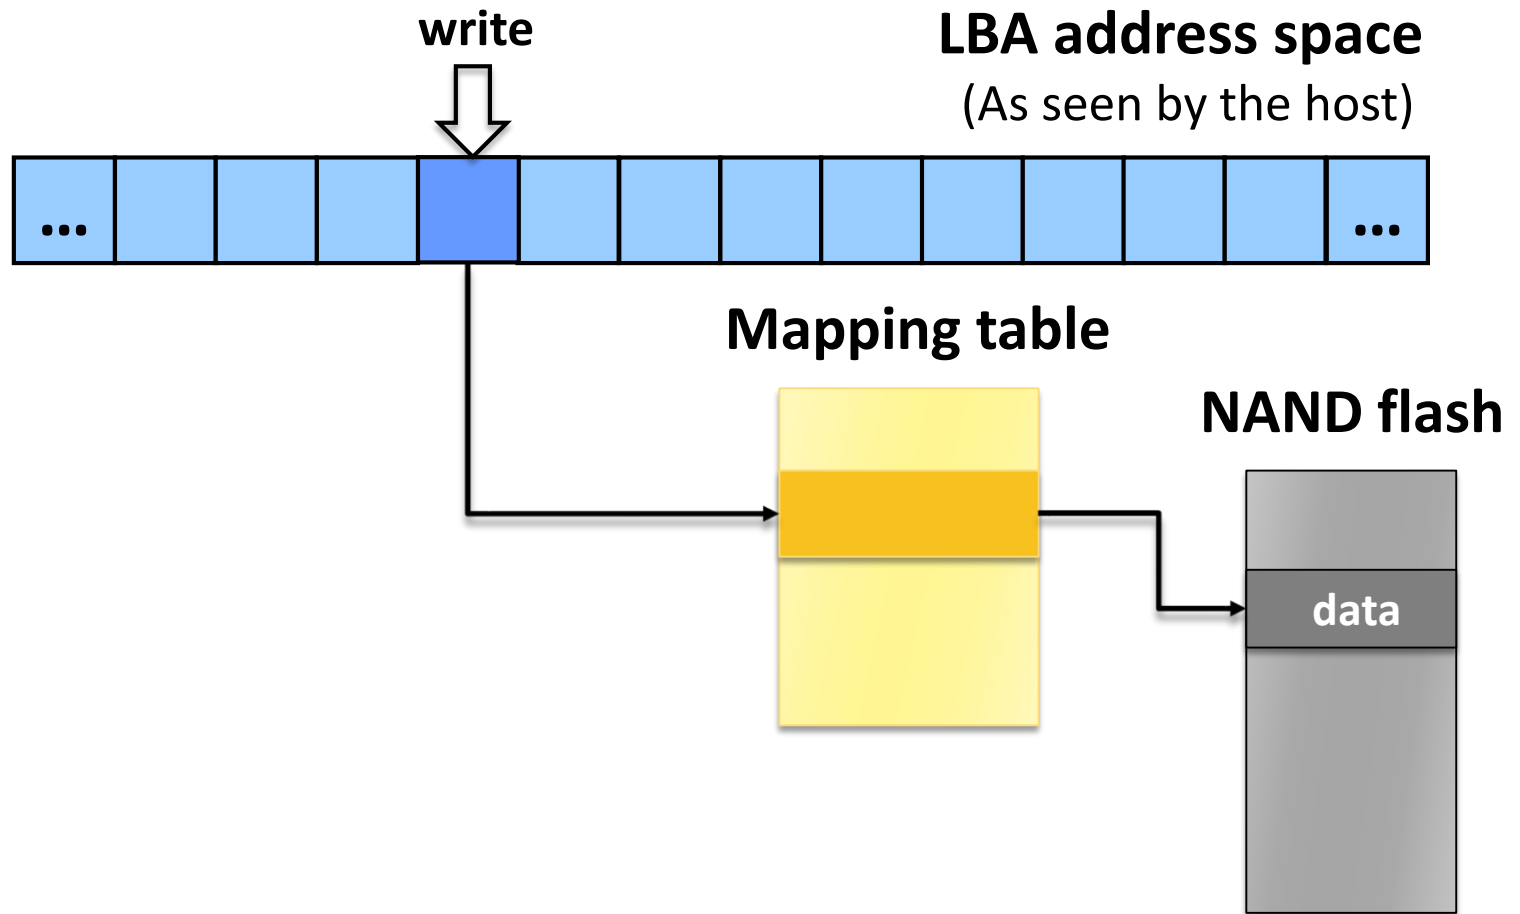

Deduplication

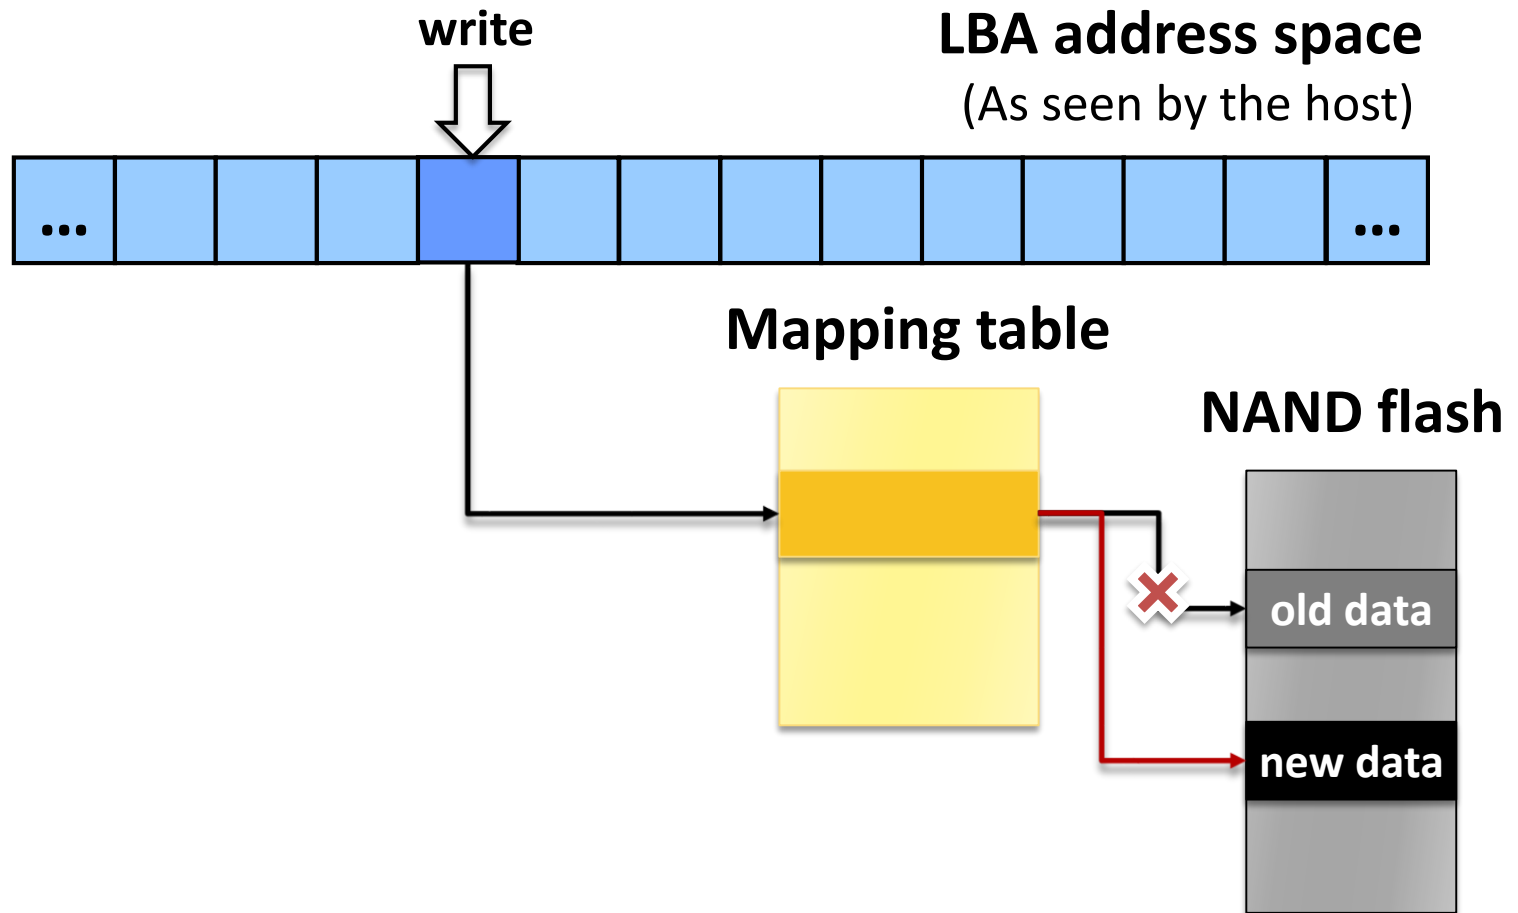

Page Mapping

Address Mapping

Address Mapping

- Required due to “no overwrite”

Mapping Schemes

- Page mapping
 - Fine-granularity page-level map table
 - Huge amount of memory space required for the map table
- Block mapping
 - Coarse-granularity block-level map table
 - Small amount of memory space required for the map table
- Hybrid mapping
 - Use both page-level and block-level map tables
 - Higher algorithm complexity

Page Mapping

- Mapping in page-level

- Logical page number \rightarrow physical page number
- Page mapping table (PMT) required
- # entries in PMT == # pages visible to OS

- Translation

- Step 1: logical sector number \rightarrow logical page number (LPN)
- Step 2: LPN \rightarrow physical page number (PPN) via PMT

Example: Page Mapping

Flash configuration

- Page size: 4KB
- # of pages / block = 4

Current state

- Written to page 0, 1, 2, 8, 4, 5

Reading page 5

Logical page #5

0000000101

Current state

- Written to page 0, 1, 2, 8, 4, 5

New requests (in order)

- Write to page 9
- Write to page 3
- **Write to page 5**

Page Mapping

▪ Pros

- Most flexible
- Efficient handling of small random writes
 - A logical page can be located anywhere within the flash storage
 - Updated page can be written to any free page

▪ Cons

- Large memory footprint
 - One page mapping entry per page
 - 32MB for 32GB (4KB page)
- Sensitive to the amount of reserved blocks (OP)
- Performance affected as the system ages

Garbage Collection

Why?

Garbage Collection

- Garbage collection (GC)
 - Eventually, FTL will run out of blocks to write to
 - GC must be performed to reclaim free space
 - Actual GC procedure depends on the mapping scheme
- GC in page-mapping FTL
 - Select victim block(s)
 - Copy all valid pages of victim block(s) to free block
 - Erase victim block(s)
 - Note: At least one free block should be reserved for GC

Example: GC in Page Mapping

Current state

- Written to page 0, 1, 2, 8, 4, 5
- Written to page 9, 3, 5

New requests (in order)

- Write to page 8
- Write to page 9
- Write to page 3
- Write to page 1
- Write to page 4

Write Amplification

- Ratio of data written to flash to data written from host
- Write Amplification Factor (WAF)
$$= \frac{\text{Bytes written to *Flash*}}{\text{Bytes written from *Host*}} = \frac{\text{Bytes written from *Host* + Bytes written during *GC*}}{\text{Bytes written from *Host*}}$$
- Generally, WAF is greater than one in flash storage
 - Due to valid page copies made from victim block to free block during GC
 - WAF is one of metrics which shows the efficiency of GC

Example: Write Amplification

Current state

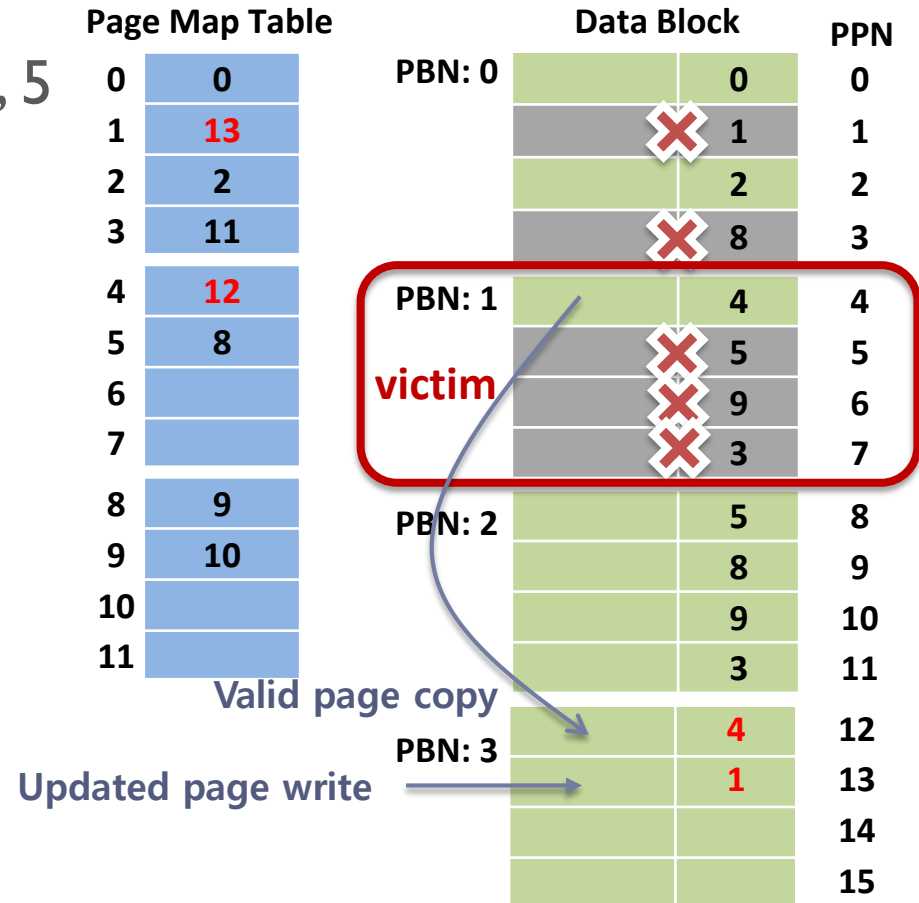

- Written to page 0, 1, 2, 8, 4, 5
- Written to page 9, 3, 5

New requests (in order)

- Write to page 8, 9, 3, 1

WAF = 1.08

- Total host writes: 13
- Total flash writes: 14

Victim Selection Policies

- Greedy policy

- Selects a block with the largest amount of invalid data
- A block with the minimum utilization u

$$u = \frac{\text{Number of valid pages in a block}}{\text{Number of Pages in a block}}$$

- Pros
 - Least valid data copying costs
 - Simple
- Cons
 - Does not perform well when there is high locality among writes
 - Does not consider wear leveling

Victim Selection Policies

- **Cost-benefit policy**

- Selects a block with the maximum

$$\frac{Benefit}{Cost} = \frac{(1 - u)}{2u} \times age$$

- u : utilization
- age : the time since the last modification
- **Pros**
 - Performs well with locality
 - Somehow helps to achieve even wear
- **Cons**
 - Computation/data overhead

Victim Selection Policies

- Cost-Age-Times (CAT) policy

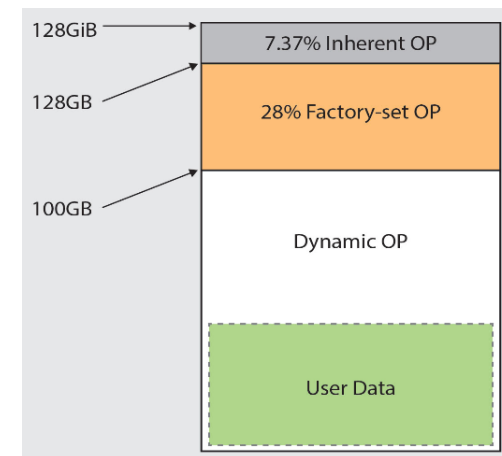

- Selects a block with the minimum

$$\frac{Cost}{Benefit} \times \frac{Times}{Age} = \frac{u}{(1 - u) \times age} \times count$$

- u : utilization
- age : the time since the last modification
- $count$: erase count for the block
- Pros
 - Performs well with locality
 - Takes block wear counts into account
- Cons
 - Computation/data overhead

Over-Provisioning

- $OP \text{ (Over-Provisioning)} = \frac{\text{Physical Capacity}}{\text{Logical Capacity}} - 1$
 - Extra media space on an SSD that does not contain user data
- Typical SSDs have more space than is advertised
 - Consumer SSDs: ~ 7%
 - 1 Gigabyte (GB) = 10^9 bytes = 1,000,000,000 bytes
 - 1 Gibibyte (GiB) = 2^{30} bytes = 1,073,741,824 bytes
 - Enterprise SSDs: > 25%
 - e.g. 100GB user space on 128GiB SSD:
~ 28% + 7% = 35%

Over-Provisioning

- **Over-Provisioning Space (OPS)** is used for
 - Firmware images
 - FTL metadata
 - Bad block remapping
 - Write buffers
- **Garbage collection cost**
 - Affected by utilization of SSD space and Over-Provisioning
 - Lower utilization → Better performance
 - Larger OP → Better performance

Over-Provisioning

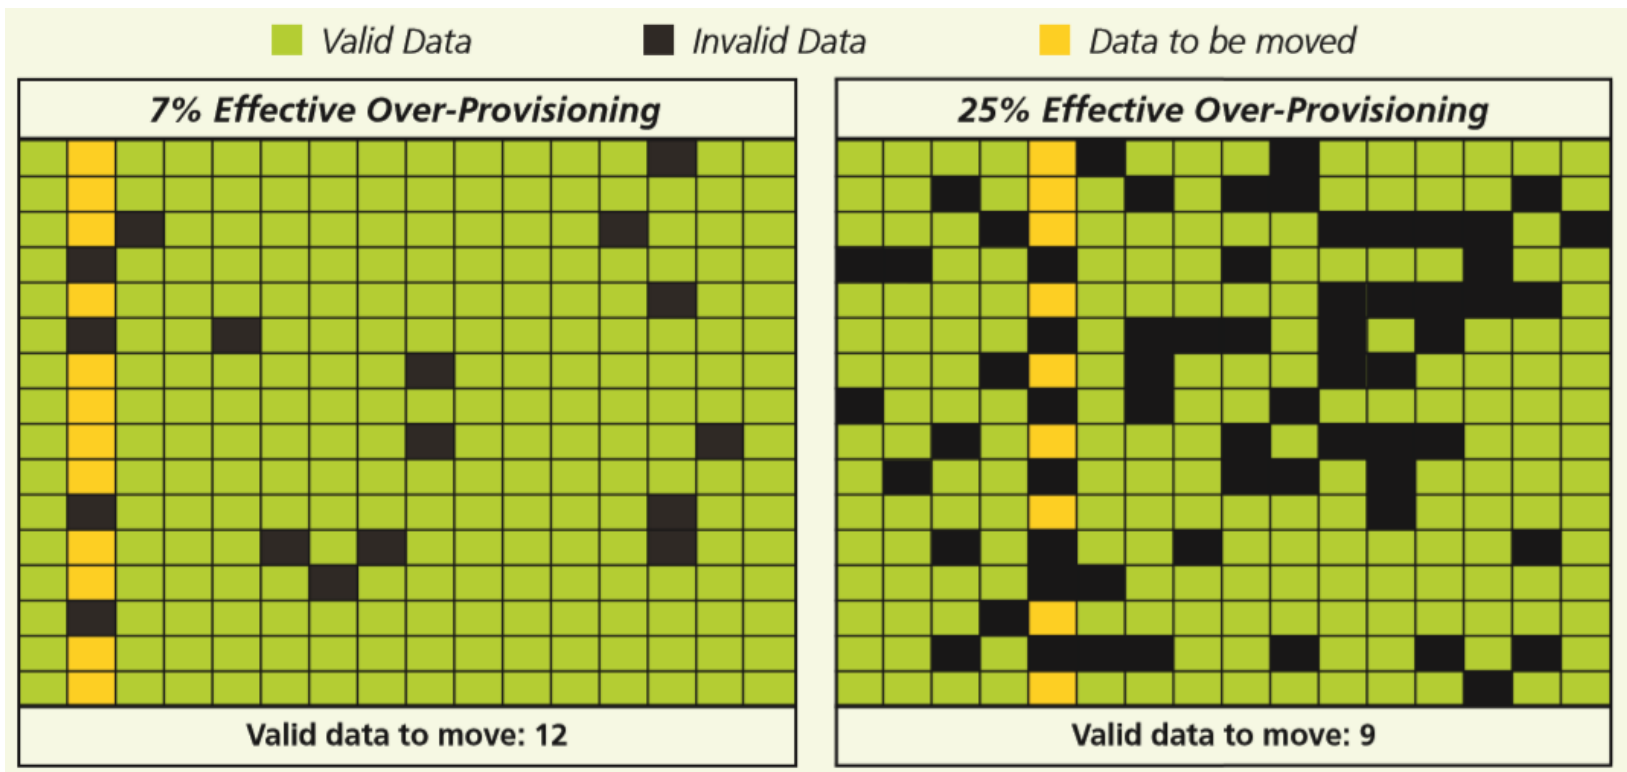

- Over-provisioning and random write workloads
 - What about for sequential write workloads?

D. Glen, Differences in Personal vs. Enterprise SSD Performance, Micron Technology, Inc.

Over-Provisioning

- Over-provisioning on GC
 - Larger OP results in lower WAF

D. Glen, Differences in Personal vs. Enterprise SSD Performance, Micron Technology, Inc.

Over-Provisioning

- Some manufacturers provide software tools to configure the amount of over-provisioning space
