

# Introduction to Pintos

Jin-Soo Kim (jinsookim@skku.edu)  
Computer Systems Laboratory  
Sungkyunkwan University  
<http://csl.skku.edu>

# Welcome to Pintos!

## ■ What is Pintos?

- An instructional operating system
- Developed by Ben Pfaff @ Stanford U.
- A real, bootable OS for 80x86 architecture
  - Run on a regular IBM-compatible PC or an x86 simulator
- The original structure and form was inspired by the Nachos instructional OS from UC Berkeley (Java-based)
- A few of the sources files are derived from code used in the MIT's advanced operating systems course
- Written in C language (with minimal assembly code)

# Bochs (1)

## ■ What is Bochs?

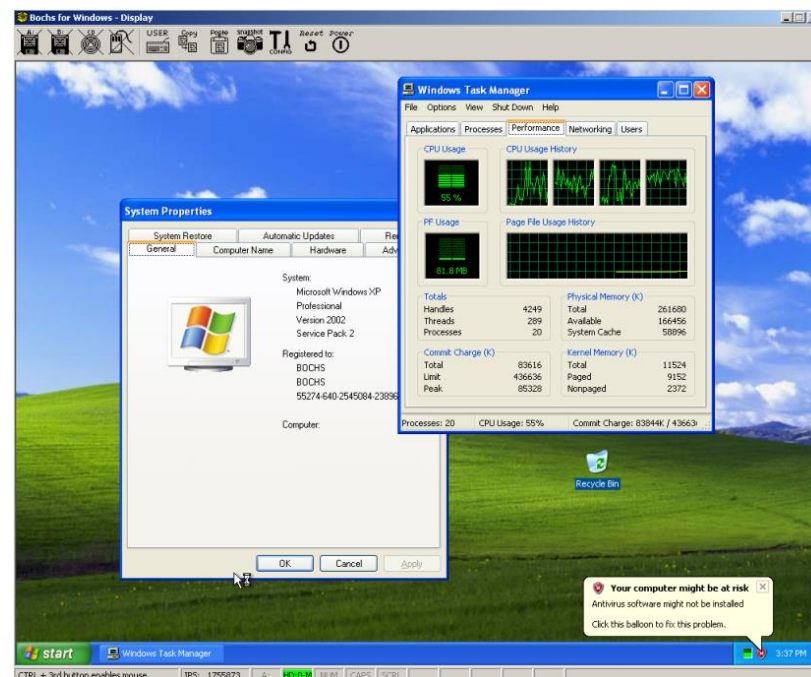

- Open-source IA-32 emulator
- Simulates a complete Intel x86 computer in software
  - Interprets every instruction from power-up to reboot
  - Has device models for all of the standard PC peripherals: keyboard, mouse, VGA card/monitor, disks, timer, network, ...
  - Supports many different host platforms: x86, PowerPC, Alpha, Sun, and MIPS
- Runs most popular x86 OSes:
  - Windows 95/98/NT/2000/XP/Vista/7, Linux, BSDs, ...
- Written in C++
- Emulation, not virtualization

# Bochs (2)

## Linux + Bochs

- We will run Pintos using Bochs on Linux
- Bochs makes it easy to develop and debug Pintos projects

# Bootstrapping Pintos

- **Step 1: Get Linux ready**
- **Step 2: Get Pintos ready**
- **Step 3: Get Bochs ready**
- **Step 4: Test if everything works fine**

# Step 1: Linux (1)

- **Install a Linux distribution on your machine**
  - Ubuntu, Fedora, Debian, ...
- **Recommended platform for this semester**
  - Ubuntu Desktop 13.04 LTS 32-bit version
  - Easier to get help from TA & instructor
  - Available from  
<http://www.ubuntu.com/download/desktop>
  - Installation manual:  
<http://www.ubuntu.com/download/help/install-ubuntu-desktop>

# Step 1: Linux (2)

## ■ Installation on a native machine

- Allocate a dedicated partition for Linux
- Can co-exist with Windows
- Fast!

## ■ Installation on a virtual machine

- VMware Player (free) or VMware Workstation (\$\$\$)
- Available from <http://www.vmware.com>
- Pre-installed VM images are available on the Internet
  - VMware virtual appliances:  
[https://solutionexchange.vmware.com/store/category\\_groups/19](https://solutionexchange.vmware.com/store/category_groups/19)
  - e.g., Ubuntu 12.04 LTS image:  
<http://www.trendsigma.net/vmware/ubuntu1204.htm>
- (cf.) <http://csl.skku.edu/CSE2003S09/Linux>

# Step 1: Linux (3)

- **Install basic development tools**

```
$ sudo apt-get install <package>
```

- build-essential
- vim, ctags, cscope
- patch, diff
- wget
- perl
- subversion, git
- ...

# Step 2: Pintos

## ■ Installing Pintos

- Available from <http://cs1.skku.edu/SSE3044F13/Resources>
  - Use this version only
- Use the following command to download Pintos

```
$ cd ~  
$ wget http://cs1.skku.edu/uploads/SSE3044F13/  
pintos.tar.gz
```
- Untar Pintos

```
$ tar xvzf pintos.tar.gz
```
- Now, Pintos source code is in `~/pintos/src`

# Step 3: Bochs (1)

- **You need Bochs to run Pintos**
  - Do not install the Bochs package from Ubuntu repositories
  - If you did, it should be removed
- **Install prerequisites for building Bochs**
  - Install X windows development libraries  
`$ sudo apt-get install xorg-dev`
  - Install curses development libraries  
`$ sudo apt-get install libncurses5-dev`

# Step 3: Bochs (2)

## ■ Install pre-built GCC 4.1.2 for Bochs

- Bochs is not compiled with the default compiler in Ubuntu (gcc-4.6.3)
- We have pre-built gcc/g++ version 4.1.2 for you
- Use our installation script

```
$ wget http://cs1.skku.edu/uploads/SSE3044F13/  
sse-gcc-installer-v3
```

```
$ chmod a+x sse-gcc-installer-v3
```

```
$ sudo ./sse-gcc-installer-v3
```

- The script will fetch and untar sse-gcc-4.1.2-[32bit|64bit].tar.gz file in your system
  - /usr/local/bin/sse-gcc, /usr/local/bin/sse-g++
- /usr/local/bin should be in your PATH

# Step 3: Bochs (3)

## ▪ Download Bochs

- From <http://bochs.sourceforge.net>
- Make sure you are downloading bochs-2.2.6.tar.gz
- You don't have to untar the source code

## ▪ Installing Bochs

- Must patch the Bochs source code for Pintos
  - Patches are available in ~/pintos/src/misc
- Use the installation script provided by Pintos:
  - ~/pintos/src/misc/bochs-2.2.6-build.sh
  - This will untar, patch, configure, compile, and install Bochs
- You need to be a superuser (root) to install Bochs in the system directory (e.g., /usr/local/bin)

# Step 3: Bochs (4)

## ▪ Running the script

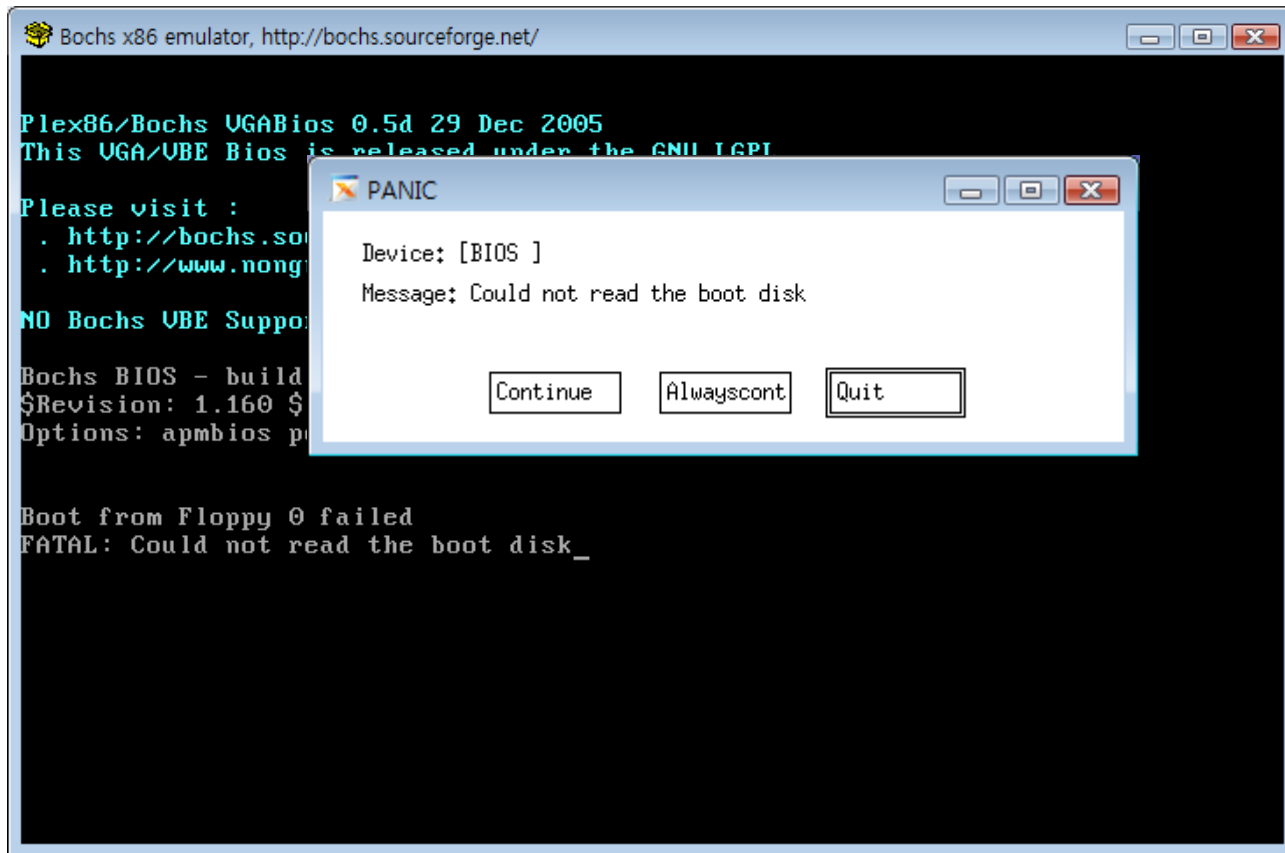

```
$ cd ~/pintos/src/misc  
$ sudo env SRCDIR=/home/jinsoo PINTOSDIR=/home/jinsoo/pintos  
DSTDIR=/usr/local CC=sse-gcc CXX=sse-g++ ./bochs-2.2.6-build.sh
```

- SRCDIR: The directory where the bochs-2.2.6-tar.gz is located
- PINTOSDIR: The base directory of Pintos
- DSTDIR: The target directory where Bochs will be installed
- CC=sse-gcc, CXX=sse-g++: Use sse-gcc/sse-g++ for C/C++ compiler

# Step 4: Testing (1)

## ■ Testing Bochs

\$ bochs ; Put \$DSTDIR/bin into your PATH

# Step 4: Testing (2)

## ■ Building Pintos

- Specify `sse-gcc` in `~/pintos/src/Make.config`
  - At line 14 & 19: `gcc` → `sse-gcc`
  - (cf.) <http://csl.skku.edu/SSE3044F12/GCCPintos>

```
$ cd ~/pintos/src/threads
```

```
$ make
```

- This will create the kernel image (`kernel.bin`) and the final OS disk image (`os.dsk`) in `~/pintos/src/threads/build`
- `os.dsk = loader.bin + kernel.bin`

# Step 4: Testing (3)

## Run Pintos

```
$ cd pintos/src/threads
```

```
$ ../utils/pintos run alarm-multiple
```

```
(alarm-multiple) thread 0: duration=10, iteration=7, product=70
(alarm-multiple) thread 1: duration=20, iteration=4, product=80
(alarm-multiple) thread 3: duration=40, iteration=2, product=80
(alarm-multiple) thread 2: duration=30, iteration=3, product=90
(alarm-multiple) thread 4: duration=50, iteration=2, product=100
(alarm-multiple) thread 1: duration=20, iteration=5, product=100
(alarm-multiple) thread 2: duration=30, iteration=4, product=120
(alarm-multiple) thread 3: duration=40, iteration=3, product=120
(alarm-multiple) thread 1: duration=20, iteration=6, product=120
(alarm-multiple) thread 1: duration=20, iteration=7, product=140
(alarm-multiple) thread 2: duration=30, iteration=5, product=150
(alarm-multiple) thread 4: duration=50, iteration=3, product=150
(alarm-multiple) thread 3: duration=40, iteration=4, product=160
(alarm-multiple) thread 2: duration=30, iteration=6, product=180
(alarm-multiple) thread 4: duration=50, iteration=4, product=200
(alarm-multiple) thread 3: duration=40, iteration=5, product=200
(alarm-multiple) thread 2: duration=30, iteration=7, product=210
(alarm-multiple) thread 3: duration=40, iteration=6, product=240
(alarm-multiple) thread 4: duration=50, iteration=5, product=250
(alarm-multiple) thread 3: duration=40, iteration=7, product=280
(alarm-multiple) thread 4: duration=50, iteration=6, product=300
(alarm-multiple) thread 4: duration=50, iteration=7, product=350
(alarm-multiple) end
Execution of 'alarm-multiple' complete.
```

# Project -1: Warming Up

# Project -1 (1)

- **Set up your own project environment**

- Install Linux
- Install all the required tools
- Install Pintos
- Install Bochs
- Capture the screen shot of working Pintos  
`$ pintos run alarm-multiple`

# Project -1 (2)

## ■ Documentation

- Specification of your environment
  - Hardware info
  - Linux distributions
  - Output of the following commands:
    - \$ `uname -a`
    - \$ `lscpu`
  - A screen shot of “alarm-multiple”

## ■ Due:

- Sep. 6 (Fri), 11:59PM (firm deadline)
- Submit via e-mail to [sse3044@csl.skku.edu](mailto:sse3044@csl.skku.edu)
- Note: This is an individual project
